<u>**In the Specification**</u>

Please delete paragraph [0033] in its entirety and replace it with the following:

[0033] Any parameter type in the method signature that is not recognized as one of the simple, Array, or Vector types will be evaluated to see if it is a reference to a Java object class. To be successfully recognized, the parameter type desirably should consist of a valid, fully qualified Java class name, an opening parenthesis character, comma-delimited parameter type names (if applicable), and a closing parenthesis character. The ParameterType names within the parentheses are used [[to]] to find a matching constructor defined in the object's class. Each ParameterType can be any simple or complex parameter type supported by WebCall. If the desired constructor takes no parameters, the parentheses should be empty.
